UCSF Building Seismic Ratings 1490 5TH AVENUE

CAAN #2021 1490 5th AVENUE, SAN FRANCISCO, CA 94122 UCSF Campus: Parnassus

Plan

West Elevation

Rating summary	Entry	Notes
UC Seismic Performance Level (rating)	V	Findings based on drawing review and ASCE 41-17 Tier 1 evaluation ¹
Rating basis	Tier 1	ASCE 41-17
Date of rating	2020	
Recommended UCSF priority category for retrofit	Priority B	Priority A = Retrofit ASAP Priority B=Retrofit at next permit application for modification
Ballpark total project cost to retrofit to IV rating	High	See recommendations on further evaluation and retrofit.
Is 2018-2019 rating required by UCOP?	Yes	
Further evaluation recommended?	No	

¹ The evaluations at UCSF translate the Tier 1 evaluation to a Seismic Performance Level rating using professional judgment discussed among the Seismic Review Committee. Non-compliant items in the Tier 1 evaluation do not automatically put a building into a particular rating category, but such items are evaluated along with the combination of building features and potential deficiencies, focused on the potential for collapse or serious damage to the gravity supporting structure that may threaten occupant safety.

Building information used in this evaluation

- Architectural Drawings by Community Design Center, "Additions and Alterations: 1490 5th Avenue," dated 23 August 1985 (5 sheets)
- Existing Architectural Drawings by Hearst & Chen Architects, "UCSF 1490 Fifth Avenue," dated 14 February 1985 (2 sheets)

Scope for completing this form

Architectural drawings were reviewed and an ASCE 41-17 Tier 1 evaluation was performed. A site visit was made on December 12, 2019 where the building exterior and basement were observed. Access to the upper floors was not available.

Brief description of structure

The building functions as faculty housing. It was reportedly built in 1905 as a single-family home. There is a threebedroom apartment on the first and second floors. The main floor plate is approximately 25 ft north-south by 41 ft east-west.

Identification of Levels: Levels are identified on plan as Ground Floor, First Floor, Second Floor, and Roof. The site slopes downward toward the northwest. The ground floor (varies, average approximately 6'-0") contains a garage, utilities, and laundry. The first floor (approximately 10'-0") consists of a kitchen, dining room, living room, den, one bedroom, a bathroom, and an entry. The second floor (approximately 10'-0") consists of two bedrooms and one bathroom. The roof is a hip roof. The basement is at grade/street level and is used as the base of the building for this evaluation.

<u>Foundation system</u>: Existing foundation drawings are not available. It is presumed there are continuous footings below bearing walls. During the site visit on December 12, 2019 continuous concrete stem wall footings were observed around the ground floor level.

<u>Structural system for vertical (gravity) load:</u> Drawings showing the existing framing are not available. It is presumed based on the age of the building that wood joists span to load bearing wood framed walls.

<u>Structural system for lateral forces</u>: Drawings showing the existing framing are not available. It is presumed based on the age of the building that a sheathed diaphragm distributes load to the interior and exterior wood framed walls sheathed with gypsum board and/or plaster. Although most of the basement ceiling was finished, we were able to determine the first floor has straight sheathing. No evidence of seismic retrofit was observed.

<u>Building Code:</u> The building was reportedly constructed in 1905, prior to a building code being enacted. However, no documentation was available to confirm the construction date.

<u>Building Condition</u>: What could be observed of the structure of the building appeared to be in fair condition; however, most of the structure was concealed behind finishes. The concrete stem walls in the garage were in poor condition, with widespread spalling and/or poor consolidation. The stucco seemed to be in good condition.

<u>Building response in 1989 Loma Prieta Earthquake</u>: The report titled "Performance of UCSF Buildings During the October 17, 1989 Loma Prieta Earthquake" by Impell Corporation stated the exterior of the building was inspected prior to the earthquake and no damage was observed.

Brief description of seismic deficiencies and expected seismic performance including structural behavior modes

- The building relies on interior and exterior walls for shear resistance. There is not enough wall present to pass the Tier 1 quick check in the transverse or longitudinal direction in any story.
- Based on the age of construction, the walls between levels are not expected to be detailed to transfer shear and overturning forces between levels.
- The building is located on a sloped site. However, there is a significant length of wall on the downhill side of the building.

- There is nearly no separation to the north and the separation to the south is approximately 2 inches. The floor levels do not align with the adjacent buildings due to the sloped site.
- The basement cripple walls were primarily sheathed with plaster and gypsum board. Based on the age of construction it is assumed the anchor bolts for the sill plate are not adequate.

Structural deficiency	Affects rating?	Structural deficiency	Affects rating?
Lateral system stress check (wall shear, column shear or flexure, or brace axial as applicable)	Y	Openings at shear walls (concrete or masonry)	N
Load path	Y	Liquefaction	Ν
Adjacent buildings	Y	Slope failure	N
Weak story	N	Surface fault rupture	N
Soft story	Ν	Masonry or concrete wall anchorage at flexible diaphragm	N
Geometry (vertical irregularities)	N	URM wall height-to-thickness ratio	N
Torsion	N	URM parapets or cornices	N
Mass – vertical irregularity	N	URM chimney	N
Cripple walls	Y	Heavy partitions braced by ceilings	N
Wood sills (bolting)	Y	Appendages	N
Diaphragm continuity	N		

Summary of review of non-structural life-safety concerns, including at exit routes.²

It appeared the chimney had been replaced with a sheet metal flue. It is likely the fireplace has been blocked off.

The water heater in the basement was anchored.

UCOP non-structural checklist item	Life safety hazard?	UCOP non-structural checklist item	Life safety hazard?	
Heavy ceilings, feature or ornamentation above large lecture halls, auditoriums, lobbies or other areas where large numbers of people congregate	None Observed	Unrestrained hazardous materials storage	None Observed	
Heavy masonry or stone veneer above exit ways and public access areas	None Observed	Masonry chimneys	None Observed	
Unbraced masonry parapets, cornices or other ornamentation above exit ways and public access areas	None Observed	Unrestrained natural gas-fueled equipment such as water heaters, boilers, emergency generators, etc.	None Observed	

Basis of Seismic Performance Level Rating

The length of wall in the subject building is below the amount required by the ASCE 41 Tier 1 procedures, and connections between walls between levels of the building and to the foundation are not adequate for resisting seismic loading. The building is listed as Priority B because there is a relatively low risk to occupant life-safety posed by conventional wood-framed construction.

Recommendations for further evaluation or retrofit

No further evaluation of this building is recommended. There is relatively low risk to occupant life-safety posed by this type of building based on historical performance of similar building types. It is recommended that work to improve the seismic performance of the building be included with any future renovation requiring a building permit.

² For these Tier 1 evaluations, we do not visit all spaces of the building; we rely on campus staff to report to us their understanding of if and where non-structural hazards may occur.

Peer review comments on rating

The structural members of the UCSF Seismic Review Committee (SRC) reviewed the evaluation on January 8, 2020 and are unanimous that the rating is IV.

Additional building data	Entry	Notes

Collapse Prevention Structural Checklist For Building Type W1-W1A

LOW AND MODERATE SEISMICITY

SEISMIC-FORCE-RESISTING SYSTEM

				Description						
_	NC O		0	REDUNDANCY: The number of lines of shear walls in each principal direction is greater than or equal to 2. (Comment A.3.2.1.1. Tier 2: Sec. 5.5.1.1) Comments:						
C O	NC ()	N/A	U	SHEAR STRESS CHECK: The shear stress in the shear walls, calculated using the Quick Check procedure of Section 4.4.3.3, is less than the following values: (Commentary: Sec. A.3.2.7.1. Tier 2: Sec. 5.5.3.1.1)						
				Structural panel sheathing 1,000 lb/ft (14.6 kN/m)						
				Diagonal sheathing 700 lb/ft (10.2 kN/m)						
				Straight sheathing 100 lb/ft (1.5 kN/m)						
				All other conditions 100 lb/ft (1.5 kN/m)						
C O	NC	N/A O	U	 Comments: No walls pass the quick check stress check. At the ground floor the wall stresses in the quick check are 336 plf in the east-west direction and 599 plf in the north-south direction compared with the allowable 200 plf. STUCCO (EXTERIOR PLASTER) SHEAR WALLS: Multi-story buildings do not rely on exterior stucco walls as the primary seismic-force-resisting system. (Commentary: Sec. A.3.2.7.2. Tier 2: Sec. 5.5.3.6.1) Comments: The street-side exterior wall is covered in stucco and counted in the quick check. 						
C O	NC	N/A	U	GYPSUM WALLBOARD OR PLASTER SHEAR WALLS: Interior plaster or gypsum wallboard is not used for shear walls or buildings more than one story high with the exception of the uppermost level of a multi-story building. (Commentary: Sec A.3.2.7.3. Tier 2: Sec. 5.5.3.6.1) Comments: Interior walls provide much of the shear resistance, particularly in the transverse (north-south) direction.						
C O	NC	N/A	-	NARROW WOOD SHEAR WALLS: Narrow wood shear walls with an aspect ratio greater than 2-to-1 are not used to resis seismic forces. (Commentary: Sec. A.3.2.7.4. Tier 2: Sec. 5.5.3.6.1) Comments: Some of the walls considered for the quick check have an aspect ratio greater than 2 to 1.						
c O	NC ()	N/A	U	WALLS CONNECTED THROUGH FLOORS: Shear walls have an interconnection between stories to transfer overturning and shear forces through the floor. (Commentary: Sec. A.3.2.7.5. Tier 2: Sec. 5.5.3.6.2)						
				Comments: Existing drawings showing wall details are not provided but it is presumed there are no ties between floors to transfer load between floors.
