## Building information used in this evaluation

- Architectural drawings by Schubart and Friedman Architects, "New Maintenance Shop for Mt. Zion Hospital and Medical Center, San Francisco, California," dated 20 October 1961, Sheets A-1 to A-4.
- Structural drawings by I. Thompson Structural Engineer, "New Maintenance Shop for Mt. Zion Hospital and Medical Center, San Francisco, California," dated 20 October 1961, Sheets 1 to 3.
- Architectural drawings by Howard A. Friedman and Associates Architects and Planners, "Day Care Center for Mt. Zion Hospital and Medical Center," dated 20 March 1978, Sheets A1 to A4.
- Structural drawings by I. Thompson and Associates, "Day Care Center for Mt. Zion Hospital and Medical Center," dated 20 March 1978, Sheets S1 to S3.
- Architectural drawings by W. Lee Pollard \& Associates Architecture, "Dialysis Relocation Building G," dated 23 October 1992, Sheets A0.1, A1.1 to A1.3, A2.1, A2.2, A3.1, A3.2, A5.1 to A5.3, A6.1, A6.2, A7.1, A9.1 to A9.4.
- Structural drawings by Rudolf Fehr Consulting Structural Engineer, "Dialysis Relocation Building G," dated 23 October 1992, Sheets S-1 to S-5.

## Additional building information known to exist

## None

## Scope for completing this form

The architectural and structural drawings for the original 1961 construction and the subsequent 1978 and 1992 renovations are used as the basis for the completed ASCE 41-17 Tier 1 evaluation. A site visit was made on 20 September 2019 where the building exterior and portions of the interior were observed.

## Brief description of structure

Building G is a patient dialysis clinic located at the corner of Scott Street and Sutter Street in San Francisco, California on the UCSF Mt. Zion campus. It is a one-story reinforced masonry structure that was constructed in 1961. It contains a rectangular floor plan that measures $87^{\prime}-6^{\prime \prime}$ in the east-west direction by approximately $40^{\prime}-0^{\prime \prime}$ in the north-south direction. It was constructed on a primarily flat site and is adjacent to Building E which was existing at the time of construction. On its first floor, Building G originally housed a machine, paint, and carpentry shop. On its second floor, it contained a 17' $-0^{\prime \prime}$ wide mezzanine located along its east elevation. In 1978, Building $G$ was converted to a geriatric day care center. At that time, a new $12^{\prime}-8^{\prime \prime}$ wide mezzanine was added to the structure along its north elevation. This space contained a restroom, a conference room, and office space. At that time, the existing east mezzanine was fully enclosed and converted into a mechanical room. In 1992, the structure was renovated a second time and converted to a patient dialysis clinic. Patient care is located on the first floor while the north mezzanine is utilized as open office space, and the east mezzanine remained as a mechanical room. The clinic offers extended hours to patients and is open 6 days a week from 5:00 am to 9:00 pm. During these hours, there are approximately 10 employees and 25 patients inside the building.

Identification of levels: The building levels are designated as the first floor (EL. 134.00), the second floor (EL. 141.75 for north mezzanine and EL. 143 ft for east mezzanine), and the roof (EL. 149.54 ft at the high point and EL. 149.45 ft at the low point). The exterior grade is relatively flat with a low point at the southeast corner of the structure and a high point at the northwest corner of the structure. An entry ramp is located at the main entrance at the southeast corner of the building.
Foundation system: The slab-on-grade is comprised of a $5^{\prime \prime}$ thick concrete slab that is reinforced with \#3 bars spaced at $15^{\prime \prime}$ each way. Perimeter masonry walls are supported by concrete grade beams that are $8 \frac{1}{2}{ }^{\prime \prime}, 9^{\prime \prime}$, and $93 / 4^{\prime \prime}$ wide by $2^{\prime}-0^{\prime \prime}$ deep. The beams are centered below the walls and contain 4-\#6 longitudinal bars at the top and bottom with \#3 ties spaced at $16^{\prime \prime}$ o.c. The grade beams span to reinforced concrete piers that are $20^{\prime \prime}$ in diameter and range in depth from 14 ft to 23 ft . They are reinforced with $4-\# 6$ longitudinal bars and \#3 ties spaced at $18^{\prime \prime}$ o.c. The piers are typically centered below the walls, except along the east and north elevation where they are set back by $1^{\prime}-9^{\prime \prime}$ and $1^{\prime}-0^{\prime \prime}$ from the outside face of wall respectively. Along these elevations, the exterior walls are supported by perpendicular grade beams which cantilever from the setback piers. This foundation configuration was likely utilized in order to avoid conflict with the adjacent Building E foundations.

In 1978, additional 20" diameter concrete piers were installed below the steel posts that were added to support the north mezzanine. The piers range in depth from 10 ft to 15 ft , and the reinforcing matched the detail originally used in 1961.

In 1992, 15" diameter by 15 ft deep concrete piers were added below a new shear wall located in the center of the structure. Grade beams that measure $12^{\prime \prime}$ wide by $1^{\prime}-6^{\prime \prime}$ deep were also added between the existing piers that support the north mezzanine.

Structural system for vertical (gravity) load: Building G contains gravity load-bearing concrete masonry walls around its perimeter on four sides. They are comprised of $4^{\prime \prime} \times 16^{\prime \prime}$ stacked bond units. The vertical wall reinforcing consists of a single layer of \#5 bars spaced at $16^{\prime \prime}$ o.c. while the horizontal reinforcing consists of 2 -\#3 bars spaced at $24^{\prime \prime}$ o.c. A reinforced concrete beam that measures $91 / 4^{\prime \prime} \times 1^{\prime}-23 / 4^{\prime \prime}$ sits on top of the masonry walls. Two interior loadbearing masonry walls are oriented in the north-south direction and support portions of the mezzanine slabs.

The roof framing consists of $2^{\prime \prime}$ unfilled metal deck that spans between $10 B 11.5$ steel beams. The deck profile appears similar to $N$-deck, and the gage is unknown. It is supported at the perimeter by a 3 " $\times 2$ " steel ledger angle that is bolted into the face of the concrete beam with $5 / 8^{\prime \prime}$ diameter bolts spaced at $2^{\prime}-8^{\prime \prime}$ o.c. The deck profile and the connection of the deck to the steel framing are unknown as the available drawings refer to the metal deck specifications which are not currently available for review. The $10 B 11.5$ steel beams are oriented in the north-south direction and form diaphragm crossties in the transverse direction. They are spaced between $6^{\prime}-3^{\prime \prime}$ to $6^{\prime}-8^{\prime \prime}$ o.c. and span approximately $20^{\prime}-0^{\prime \prime}$ from the exterior walls to 16 W 36 girders oriented in the east-west direction. The girders are located along the center longitudinal axis of the structure at the roof high point. They span between the exterior masonry walls and an interior shear wall.

The east mezzanine slab from the 1961 original construction is an 8 " thick concrete slab that is reinforced with \#4 bars spaced at $16^{\prime \prime}$ o.c. at the top and bottom in both directions. It is supported by walls around its perimeter as well as one central interior wall that is oriented in the east-west direction. The masonry wall construction typically stops at the underside of the slab and restarts at the top of the slab. As such, the slab bears on the wall and is connected to the wall with \#5 vertical dowels spaced at $16^{\prime \prime}$ o.c. which run through the slab from the wall below and into the wall above.

The north mezzanine slab was added to Building G in 1978. It is comprised of a $61 / 2^{\prime \prime}$ thick reinforced concrete slab that contains \#5 bars at $16^{\prime \prime}$ o.c. at the bottom. It spans in the north-south direction and is supported on its southern edge by a row of $21 / 2^{\prime \prime} \times 2 \frac{1}{2 \prime \prime}$ steel posts. On its northern edge, it is supported by the existing masonry wall, and it is connected to this wall by $3 / 4$ " diameter "Parabolts" spaced at 12 " o.c. that are located at the mid-depth of the slab. The Parabolt is a proprietary masonry insert that was used during construction at that time. A wall anchor is inserted into the existing wall, and an accompanying threaded rod was nested into the anchor. During the 1992 renovation, a ledger angle was added to further reinforce the connection of the mezzanine to the wall. This $4^{\prime \prime} \times 4^{\prime \prime} \times 3 / 8^{\prime \prime}$ steel angle is bolted to the underside of the slab with $1 / 2^{\prime \prime}$ diameter bolts spaced at $12^{\prime \prime}$ o.c. and is bolted to the wall with $5 / 8^{\prime \prime}$ diameter bolts spaced at $16^{\prime \prime}$ o.c. This angle was observed in the field.

Structural system for lateral forces: The lateral force-resisting system is comprised of bearing reinforced concrete masonry shear walls located around the building perimeter and at the interior. In the transverse direction, three walls resist forces at the roof level, and four walls resist forces at the second floor below the mezzanine slabs. The walls are well spaced apart and limit the span of the diaphragm to a maximum of $38^{\prime}-6^{\prime \prime}$. In the longitudinal direction, two walls resist forces at the roof level, and three walls resist forces at the second floor. In this direction, the diaphragm spans approximately $40^{\prime}-0^{\prime \prime}$. The original walls contained a number of window and door openings. During both the 1978 and 1992 renovation, these openings were reconfigured with new openings added and existing openings infilled. In 1992, a new centrally located reinforced concrete shear wall was built in the transverse direction. It is $16^{\prime \prime}$ thick and reinforced with \#5 bars spaced at $12^{\prime \prime}$ o.c. on each face in the vertical direction. The horizontal reinforcing consists of \#4 bars spaced at $12^{\prime \prime}$ o.c. on each face. At the wall ends, these bars are hooked around $3-\# 6$ vertical boundary bars with 90 -degree hooks. The wall is connected to the roof with a steel truss constructed from WT $3 \times 10$ chord members and $3^{\prime \prime} \times 2^{\prime \prime}$ rectangular tube diagonal members. At the underside of the roof framing, steel channels were added to both sides of an existing reinforced concrete beam and this built-up beam assembly serves as a collector element to deliver load from the roof diaphragm to the vertical truss and down into the wall.

The roof diaphragm consists of unfilled metal deck, and its connection to the roof framing is unknown. An in-plane steel truss that serves as diaphragm bracing is located in the center of the roof and spans in the east-west direction. The truss is $6^{\prime}-3^{\prime \prime}$ deep and is comprised of diagonal 5B5.75 members. The east and west walls are braced out-ofplane by the flutes of the metal deck which are oriented perpendicular to these walls. The deck is connected to the walls with a steel ledger angle. The walls are braced out-of-plane in the north-south direction by the steel roof framing. These beams bear on an $8^{\prime \prime} \times 4^{\prime \prime}$ steel angle that is connected to the wall with $4-5 / 8^{\prime \prime}$ diameter bolts. The angle is then connected to the beam bottom flange with 2-5/8" diameter bolts.

Building condition: Good. No on-going maintenance problems were noted by the building engineer.

## Building response in 1989 Loma Prieta Earthquake: Unknown.

## Brief description of seismic deficiencies and expected seismic performance including mechanism of nonlinear response and structural behavior modes

Identified and potential seismic deficiencies of the building include the following:

- The connection of the metal deck to the steel framing is unknown. The metal deck specifications are referenced on the structural drawings, however; these documents are not currently available for review. Given the building vintage and the attention to detail present in the available construction documents, it is assumed that a nominal connection of the metal deck to the steel roof framing was provided.
- The mezzanine diaphragm consists of split levels as the east and north slabs are located at different elevations.
- The north mezzanine is connected to walls on three sides and does not contain lateral support along its southern edge.
- The foundation piers are typically connected together with grade beams in one direction only. The slab-on-grade may act as foundation ties.

## Summary of review of nonstructural life-safety concerns, including at exit routes. ${ }^{2}$

There are two nonstructural components of interest in this structure. The first is a small canvas sheathed canopy that was added above the main entrance in 1992. It is supported by tube steel framing that spans between a steel post and the exterior wall of the structure. The second is a $4^{\prime}-4^{\prime \prime}$ wide soffit was constructed along the south interior wall to offer privacy over the patient vestibules. It is framed with metal stud framing clad with gypsum board on all sides. The anchorage of these items is beyond the scope of the Tier 1 assessment. However, it is noted that they are

[^1]both potential falling hazards as the canopy is located over the main egress and the soffit is located over the patient vestibules.

| UCOP nonstructural checklist item | Life safety hazard? | UCOP nonstructural checklist item | Life safety hazard? |
| :---: | :---: | :---: | :---: |
| Heavy ceilings, feature or ornamentation above large lecture halls, auditoriums, lobbies or other areas where large numbers of people congregate | None observed | Unrestrained hazardous materials storage | None observed |
| Heavy masonry or stone veneer above exit ways and public access areas | None observed | Masonry chimneys | None observed |
| Unbraced masonry parapets, cornices or other ornamentation above exit ways and public access areas | None observed | Unrestrained natural gas-fueled equipment such as water heaters, boilers, emergency generators, etc. | The building engineer notes that natural gas is not supplied to Building G. It is however, supplied to the vacant adjacent structure, Building E . |

## Basis of Seismic Performance Level rating

Building G is a rectangular structure with a plan aspect ratio of approximately $1 \mathrm{~W}: 2 \mathrm{~L}$. The walls are optimally located around its entire perimeter and are well-spaced on the interior. The structure is regular, located on a flat site, and does not contain discontinuous shear walls or geometric irregularities. The number of walls in each direction increase from the roof down to the first floor. The overturning forces are likely low given the shear wall aspect ratio of $1 \mathrm{~V}: 2.5 \mathrm{H}$ in the transverse direction and $1 \mathrm{~V}: 5.7 \mathrm{H}$ in the longitudinal direction.

Building $G$ was constructed in close proximity to the adjacent Building E which is located on its west elevation. The two structures are separated by a $3^{\prime \prime}$ wide gap which is larger than the $2.8^{\prime \prime}$ gap required by the Tier 1 assessment.

In the longitudinal direction, the wall stresses are 12 psi between the roof to second floor and 37 psi the second floor to first floor. In the transverse direction, the walls stresses are 29 psi between the roof to second floor and 61 psi between the second floor to first floor. These stresses are below the Tier 1 acceptance limit of 70 psi.

The roof contains a flexible metal deck diaphragm that contains steel cross bracing in the direction parallel to the deck flutes. The connection of the metal deck to the steel framing is unknown as this detail references the specifications which are not currently available for review. For this assessment, it is assumed that a nominal connection, such as puddle welding of the deck down flutes, was provided. The second floor is comprised of two reinforced concrete mezzanine slabs. These slabs are located at different elevations and are therefore not likely to share load. However, each slab is laterally braced and connected to shear walls on at least three sides.

The steel bolts in the anchorage connections at the roof and second floor slabs were checked for out-of-plane forces and were found to be adequate.

The building is assigned a Seismic Performance Level Rating of IV because the structure does not contain any significant deficiencies. Diaphragm spans and aspect ratios are low. In addition, the walls are well configured with no significant openings or discontinuities, and the wall stresses are low.

## Recommendations for further evaluation or retrofit

No additional assessment is required.

## Peer review comments on rating

The structural members of the UCSF Seismic Review Committee (SRC) reviewed the evaluation on 10 October 2019 and were unanimous that the Seismic Performance Level Rating is Level IV. No additional assessment is required.

| LOW SEISMICITY |  |
| :---: | :---: |
| BUILDING SYSTEMS - GENERAL |  |
|  | Description |
| $\begin{array}{llcc} \hline C & N C & N / A & U \\ - & O & O & O \end{array}$ | LOAD PATH: The structure contains a complete, well-defined load path, including structural elements and connections, that serves to transfer the inertial forces associated with the mass of all elements of the building to the foundation. (Commentary: Sec. A.2.1.1. Tier 2: Sec. 5.4.1.1) <br> Comments: Unfilled metal deck with steel beam crossties functions as the roof diaphragm to deliver lateral forces to the reinforced masonry shear walls in both directions. Reinforced concrete slabs are located at the second floor and serve as diaphragm elements for the mezzanine levels. These are either doweled or bolted into the shear walls. The shear walls are continuous to the foundation and are supported by reinforced concrete grade beams and concrete piers. |
| $\begin{array}{cccc} C & N C & N / A & U \\ \bullet & 0 & O & O \end{array}$ | ADJACENT BUILDINGS: The clear distance between the building being evaluated and any adjacent building is greater than $0.25 \%$ of the height of the shorter building in low seismicity, $0.5 \%$ in moderate seismicity, and $1.5 \%$ in high seismicity. (Commentary: Sec. A.2.1.2. Tier 2: Sec. 5.4.1.2) <br> Comments: Mt. Zion Building E is located in close proximity to the west elevation of Building G. The clear distance between these structures as shown on the drawings is 3 ". This measurement was confirmed in the field. Based upon the building height of $15^{\prime}-6^{\prime \prime}$, the required gap is $2.8^{\prime \prime}$. |
| $\begin{array}{cccc} C & N C & N / A & U \\ C & C & O & O \end{array}$ | MEZZANINES: Interior mezzanine levels are braced independently from the main structure or are anchored to the seismic-force-resisting elements of the main structure. (Commentary: Sec. A.2.1.3. Tier 2: Sec. 5.4.1.3) <br> Comments: The second floor is comprised of two mezzanine slabs. The east mezzanine serves as a mechanical floor and is connected to shear walls on all sides. Detail CS2 in the 1961 drawings shows the slab reinforcement hooked into the CMU walls. <br> The north mezzanine serves as open office space and is connected to the shear walls on three sides. Detail BS2 in the 1978 drawings specifies a threaded rod insert that connects the slab to the CMU walls. At the time of the 1978 renovation, a steel angle was added on the underside of the north mezzanine to improve the load transfer between the slab and the north wall, as depicted in Detail 7/S-1. |

| FOUNDATION CONFIGURATION |  |
|  | Description |
| $\begin{array}{llcc} C & N C & N / A & U \\ - & C & 0 & 0 \end{array}$ | OVERTURNING: The ratio of the least horizontal dimension of the seismic-force-resisting system at the foundation level to the building height (base/height) is greater than $0.6 S_{a}$. (Commentary: Sec. A.6.2.1. Tier 2: Sec. 5.4.3.3) <br> Comments: <br> The building width is $B=40^{\prime}-0^{\prime \prime}$ from Grid $A$ to $C$. The building height from the $1^{\text {st }}$ floor to the roof is $\begin{aligned} & \mathrm{H}=15^{\prime \prime}-6 ", \\ & \mathrm{~B} / \mathrm{H}=2.58 \\ & \mathrm{Sa}=1.43 \mathrm{~g} \text { for at } \mathrm{BSE}-2 \mathrm{E} \\ & 0.6 \times \mathrm{Sa}=0.86 \\ & \mathrm{~B} / \mathrm{H}>0.6 \mathrm{Sa} . \end{aligned}$ |
| $\begin{array}{cccc} C & N C & N / A & U \\ C & C & C & C \end{array}$ | TIES BETWEEN FOUNDATION ELEMENTS: The foundation has ties adequate to resist seismic forces where footings, piles, and piers are not restrained by beams, slabs, or soils classified as Site Class A, B, or C. (Commentary: Sec. A.6.2.2. Tier 2: Sec. 5.4.3.4) <br> Comments: Per "Table 1 - UCSF Group 3 Buildings Geotechnical Characteristics and Geohazards" by Egan (2019), the soil is classified as Site Class D. Per details on Sheet 1 in 1961 structural drawings, concrete piers are restrained by grade beams in one direction and by a 5 " thick concrete slab-on-grade. |

Note: C = Compliant NC=Noncompliant $\mathbf{N} / \mathbf{A}=$ Not Applicable U = Unknown

## LOW AND MODERATE SEISMICITY

## SEISMIC-FORCE-RESISTING SYSTEM

|  | Description |
| :---: | :---: |
| C NC N/A U | REDUNDANCY: The number of lines of shear walls in each principal direction is greater than or equal to 2 . (Commentary: Sec. A.3.2.1.1. Tier 2: Sec. 5.5.1.1) <br> Comments: Due to the rectangular configuration and the exterior CMU walls, there are at least 2 lines of shear walls in each direction. Below the mezzanine level, there are 3 lines of walls in the longitudinal ( $\mathrm{E}-\mathrm{W}$ ) direction, and 4 lines of wall in the transverse ( $\mathrm{N}-\mathrm{S}$ ) direction. |
| C NC N/A U | SHEAR STRESS CHECK: The shear stress in the reinforced masonry shear walls, calculated using the Quick Check procedure of Section 4.4.3.3, is less than $70 \mathrm{Ib} / \mathrm{in}^{2}{ }^{2}(0.48 \mathrm{MPa})$. (Commentary: Sec. A.3.2.4.1. Tier 2: Sec. 5.5.3.1.1) <br> Comments: The maximum calculated wall stress is 61 psi which is below the ASCE 41 limit of 70 psi for reinforced masonry wall at all stories. |
| C NC N/A U | REINFORCING STEEL: The total vertical and horizontal reinforcing steel ratio in reinforced masonry walls is greater than 0.002 of the wall with the minimum of 0.0007 in either of the two directions; the spacing of reinforcing steel is less than 48 in. ( 1220 mm ), and all vertical bars extend to the top of the walls. (Commentary: Sec. A.3.2.4.2. Tier 2: Sec. 5.5.3.1.3) <br> Comments: Note EAS2 in 1961 structural drawings specifies typical condition of 8 " concrete block walls reinforced with $2-\# 3$ horizontal bars at 24 " o.c. ( $\rho_{\text {hor }}=0.0012$ ) and a single layer of \#5 vertical bars at 16 " o.c. ( $\rho_{\text {vert }}=0.0025$ ). |

## STIFF DIAPHRAGMS

|  |  |  | Description |  |
| :--- | :--- | :--- | :--- | :--- |
| $\mathbf{C}$ | $\mathbf{N C}$ | $\mathbf{N} / \mathbf{A}$ | $\mathbf{U}$ | TOPPING SLAB: Precast concrete diaphragm elements are interconnected by a continuous reinforced concrete topping <br> slab. (Commentary: Sec. A.4.5.1. Tier 2: Sec. 5.6.4) <br> Comments: The building does not contain precast diaphragms. |

| CONNECTION |  |
| :---: | :---: |
|  | Description |
| $\begin{array}{lccc} \hline C & N C & N / A & U \\ C & C & C & 0 \end{array}$ | WALL ANCHORAGE: Exterior concrete or masonry walls that are dependent on the diaphragm for lateral support are anchored for out-of-plane forces at each diaphragm level with steel anchors, reinforcing dowels, or straps that are developed into the diaphragm. Connections have strength to resist the connection force calculated in the Quick Check procedure of Section 4.4.3.7. (Commentary: Sec. A.5.1.1. Tier 2: Sec. 5.7.1.1) <br> Comments: Details ADS3 and AES3 in the 1961 structural drawings show ledger angles bolted to the perimeter top beams; however, the connection between these angles and the roof diaphragm is unknown Details refer to metal deck specifications, which is unavailable. Wall anchorage for out-of-plane forces in the transverse (N-S) direction with the steel framing acting as cross ties is shown on Det. CBS3 in 1961 drawings. For the longitudinal (E-W) direction, the connections between the walls and the steel framing rely on Det. ES3 in 1961 drawings. Anchorage connections are adequate when performing the Quick Check. After the 1992 alterations, a steel angle connecting the underside of the mezzanine to the north wall was added. Steel anchors for this configuration are adequate when performing the Quick Check. |
| $\begin{array}{llll} \hline \mathbf{C} & \mathbf{N C} & \mathbf{N} / \mathbf{A} & \mathbf{U} \\ \mathrm{C} & \mathrm{C} & \bullet & 0 \end{array}$ | WOOD LEDGERS: The connection between the wall panels and the diaphragm does not induce cross-grain bending or tension in the wood ledgers. (Commentary: Sec. A.5.1.2. Tier 2: Sec. 5.7.1.3) <br> Comments: The building does not contain wood ledgers. |
| $\begin{array}{cccc} C & N C & N / A & U \\ C & C & C & 6 \end{array}$ | TRANSFER TO SHEAR WALLS: Diaphragms are connected for transfer of seismic forces to the shear walls. (Commentary: Sec. A.5.2.1. Tier 2: Sec. 5.7.2) <br> Comments: It is unknown whether the roof metal deck is connected to the steel ledger angles around the perimeter of the CMU walls. The mezzanine slabs at the second floor are connected to the CMU walls with \#5 dowels spaced at 16 " o.c or $5 / 8^{\prime \prime}$ diameter bolts spaced at 16 " o.c. |
| $\begin{array}{llll} C & N C & N / A & U \\ C & C & C & 0 \end{array}$ | TOPPING SLAB TO WALLS OR FRAMES: Reinforced concrete topping slabs that interconnect the precast concrete diaphragm elements are doweled for transfer of forces into the shear wall or frame elements. (Commentary: Sec. A.5.2.3. Tier 2: Sec. 5.7.2) <br> Comments: Building does not contain topping slabs or precast concrete diaphragms. |
| $\begin{array}{lccc} \hline C & N C & N / A & U \\ C & C & O & 0 \end{array}$ | FOUNDATION DOWELS: Wall reinforcement is doweled into the foundation. (Commentary: Sec. A.5.3.5. Tier 2: Sec. 5.7.3.4) <br> Comments: Per Detail ES1 in the 1961 structural drawings, the CMU walls are doweled into the foundation. |
| $\begin{array}{cccc} C & N C & N / A & U \\ \bullet & 0 & 0 & 0 \end{array}$ | GIRDER-COLUMN CONNECTION: There is a positive connection using plates, connection hardware, or straps between the girder and the column support. (Commentary: Sec. A.5.4.1. Tier 2: Sec. 5.7.4.1) <br> Comments: Columns in this building are limited to the southern edge of the north mezzanine. Detail DDS2 in the 1978 drawings show a positive connection between the HSS columns to the beams. |

## HIGH SEISMICITY (COMPLETE THE FOLLOWING ITEMS IN ADDITION TO THE ITEMS FOR LOW AND MODERATE SEISMICITY)

## STIFF DIAPHRAGMS

|  | Description |
| :---: | :---: |
| C NC N/A U | OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls are less than $25 \%$ of the wall length. (Commentary: Sec. A.4.1.4. Tier 2: Sec. 5.6.1.3) <br> Comments: The stair on the northwest side of the structure is $11^{\prime}-0^{\prime \prime}$ long, and the adjacent wall is $88^{\prime}-0^{\prime \prime}$ long. |
| C NC N/A U <br> C C O | OPENINGS AT EXTERIOR MASONRY SHEAR WALLS: Diaphragm openings immediately adjacent to exterior masonry shear walls are not greater than $8 \mathrm{ft}(2.4 \mathrm{~m})$ long. (Commentary: Sec. A.4.1.6. Tier 2: Sec. 5.6.1.3) <br> Comments: The stair on the west end of the north wall creates an $11^{\prime}-0$ " long opening in the north mezzanine. |
| FLEXIBLE DIAPHRAGMS |  |
|  | Description |
| $C \text { NC N/A U }$ | CROSS TIES: There are continuous cross ties between diaphragm chords. (Commentary: Sec. A.4.1.2. Tier 2: Sec. 5.6.1.2) Comments: Steel 10B11.5 beams in the transverse (N-S) direction function as cross ties between the north and south exterior walls. |
| $\begin{array}{cccc} \mathbf{C} & \mathbf{N C} & \mathbf{N} / \mathbf{A} & \mathbf{U} \\ C & C & C & C \end{array}$ | OPENINGS AT SHEAR WALLS: Diaphragm openings immediately adjacent to the shear walls are less than $25 \%$ of the wall length. (Commentary: Sec. A.4.1.4. Tier 2: Sec. 5.6.1.3) <br> Comments: Skylight openings at the roof level are not adjacent to shear walls. |
| $\begin{array}{cccc} C & \text { NC } & \text { N/A } & \mathbf{U} \\ C & C & C & C \end{array}$ | OPENINGS AT EXTERIOR MASONRY SHEAR WALLS: Diaphragm openings immediately adjacent to exterior masonry shear walls are not greater than $8 \mathrm{ft}(2.4 \mathrm{~m})$ long. (Commentary: Sec. A.4.1.6. Tier 2: Sec. 5.6.1.3) <br> Comments: Skylight openings at the roof level are not adjacent to shear walls. |
| $\begin{array}{cccc} C & N C & N / A & U \\ C & C & C & C \end{array}$ | STRAIGHT SHEATHING: All straight-sheathed diaphragms have aspect ratios less than 2-to-1 in the direction being considered. (Commentary: Sec. A.4.2.1. Tier 2: Sec. 5.6.2) <br> Comments: The structure does not contain straight sheathing. |

| $\begin{array}{cccc} C & N C & N / A & U \\ C & 0 & \bullet & 0 \end{array}$ | SPANS: All wood diaphragms with spans greater than $24 \mathrm{ft}(7.3 \mathrm{~m})$ consist of wood structural panels or diagonal sheathing. (Commentary: Sec. A.4.2.2. Tier 2: Sec. 5.6.2) <br> Comments: The structure does not contain wood diaphragms. |
| :---: | :---: |
| $\begin{array}{cccc} C & N C & N / A & U \\ C & 0 & \bullet & 0 \end{array}$ | DIAGONALLY SHEATHED AND UNBLOCKED DIAPHRAGMS: All diagonally sheathed or unblocked wood structural panel diaphragms have horizontal spans less than $40 \mathrm{ft}(12.2 \mathrm{~m})$ and aspect ratios less than or equal to 4 -to-1. (Commentary: Sec. A.4.2.3. Tier 2: Sec. 5.6.2) <br> Comments: The structure does not contain wood diaphragms. |
| $\begin{array}{cccc} C & N C & N / A & U \\ C & C & \bullet & C \end{array}$ | OTHER DIAPHRAGMS: Diaphragms do not consist of a system other than wood, metal deck, concrete, or horizontal bracing. (Commentary: Sec. A.4.7.1. Tier 2: Sec. 5.6.5) <br> Comments: The structure contains a metal deck diaphragm at the roof. |
| CONNECTIONS |  |
|  | Description |
| $\begin{array}{llll} \hline \mathbf{C} & \mathrm{NC} & \mathrm{~N} / \mathbf{A} & \mathbf{U} \\ \mathrm{C} & \mathrm{C} & \bullet & 0 \end{array}$ | STIFFNESS OF WALL ANCHORS: Anchors of concrete or masonry walls to wood structural elements are installed taut and are stiff enough to limit the relative movement between the wall and the diaphragm to no greater than $1 / 8 \mathrm{in}$. ( 3 mm ) before engagement of the anchors. (Commentary: Sec. A.5.1.4. Tier 2: Sec. 5.7.1.2) <br> Comments: Anchors are not connected to wood structural elements. |

## APPENDIX D

## Quick Check Calculations

## Flat Load Tables

|  | Seismic Weight | Dead Load |  |
| :--- | :---: | :---: | :--- |
| ROOF | psf | psf | Remarks |
| Mechanical equipment | 5 | 10 | Roof top equipment consists of duct work |
| Roofing, waterproofing, and insulation | 5 | 5 | Built-up roof (smooth-surfaced) on 1/2" rigid insulation |
| Metal deck | 2 | 2 | 18 ga. Metal deck assumed |
| Beams/girders | 11 | 11 | Concrete beams around perimeter and steel wide flange framing below roof |
| Steel truss | 0.3 | 0.3 | Steel truss added after 1992 alterations |
| MEP | 3 | 3 | MEP hung from underside of roof slab |
| Ceiling, lighting, and misc. | 5 | 5 | Acoustic panel ceiling, lighting, and misc. hung from underside of roof slab |
| Columns | 0 | 0 |  |
| Partitions | 0 | 0 |  |
| Total | 32 | 37 |  |

1 - The equipment is assumed to weigh 10 psf where it is located. The equipment is located on approximately $1 / 2$ of the room area and therefore, 5 psf is assumed for seismic mass.
2 - Excluding the steel truss, the roof framing was not modified during the 1978 and 1992 alterations.
3 - The steel truss located on Grid 2 is composed of TS $4 \times 4 \times 1 / 4$ posts, WT $3 \times 10$ chords, and TS $3 \times 2 \times 1 / 4$ diagonals in web.
4 - The roof is directly supported by CMU walls and the steel truss. No columns extend to the roof.
5 - No partitions extend to the roof.

|  | Seismic Weight | Dead Load |  |
| :--- | :---: | :---: | :--- |
| EAST MEZZANINE | psf | psf | Remarks |
| 2nd Floor MEP Rm. | 10 | 20 | Estimated equipment weight |
| Mechanical equipment | 100 | 100 | 8 " NWC slab |
| Slab | 0 | 0 | CMU walls support the slab. |
| Beams/girders | 5 | 5 | MEP hung from underside of roof slab |
| MEP | 4 | 4 | Lay-in ceiling, lighting, and misc. hung from underside of floor slab |
| Ceiling, lighting, and misc. | 0 | 0 |  |
| Columns | 5 | 0 |  |
| Partitions | 124 | 129 |  |
| Total |  |  |  |

1 - This flat load is located at the second floor between Grids A-C/3-4. at EL. $9^{\prime}-0$ " relative to the first floor.
2 - The equipment is assumed to weigh 20 psf where it is located. The equipment is located on approximately $1 / 2$ of the room area and therefore, 10 psf is assumed for seismic mass.
3 - The mechanical framing is part of the original 1961 structure. The thickness is specified on Det. CS2 /S2.
4 - The concrete slab is directly supported by original CMU walls.
5 - The partitions are located between the first floor and the underside of the mechanical room only.

|  | Seismic Weight | Dead Load |  |
| :--- | :---: | :---: | :--- |
| SOFFIT | psf | psf | Remarks |
| South Elevation | 6 | 6 | Metal stud framing encased in gyp. board |
| Soffit framing | 3 | 3 | Lighting, and misc. hung from underside |
| Lighting and misc. | 1 | 0 | HSS steel columns |
| Columns | 0 | 0 |  |
| Partitions | 10 | 9 |  |
| Total |  |  |  |

1 - This flat load represents an interior nonstructural soffit that is located on the south wall between Grids B.3-C/1-3. at EL. 8'-8" relative to the first floor.
2 - Per Det $1 / \mathrm{S}-5$, assembly is comprised of $C$ joists at 16 " o.c. covered with gyp. board.
3 - Flat load includes weight of (1) HSS $4 \times 4 \times 1 / 4$ and (7) HSS $2.5 \times 2.5 \times 3 / 16$ columns below soffit in a $411 \mathrm{ft}^{2}$ area. Column trib. height is $4^{\prime}-44^{\prime \prime}$.

|  | Seismic Weight | Dead Load |  |
| :--- | :---: | :---: | :--- |
| NORTH MEZZANINE <br> 2nd Floor Open Office | psf | psf | Remarks |
| Flooring | 5 | 5 | Carpet and vinyl composition tiles |
| Slab | 81 | 81 | $6.5^{\prime \prime}$ NWC slab |
| Beams/girders | 1 | 1 | Concrete beam below slab and steel angle at interface with wall |
| MEP | 5 | 5 | MEP hung from underside of roof slab |
| Ceiling, lighting and misc. | 4 | 4 | Lay-in ceiling, lighting, and misc. hung from underside of floor slab |
| Columns | 0.2 | 0 | HSS steel columns |
| Partitions | 5 | 0 |  |
| Total | 102 | 97 |  |

1 - This flat load is located at the second floor between Grids A-A.3/1-4 at EL. 7'-9" relative to the first floor.
2 - This mezzanine was constructed during the 1978 renovation. The slab thickness is specified on Det. BSE / S2.
3 - During the 1992 renovation, a concrete beam was added on Grid 3, as shown on Det. 3/S-4.
4 - The concrete slab is supported by CMU walls.
5 -The flat load includes weight of (1) HSS $4 \times 4 \times 1 / 4$ and (6) HSS $2.5 \times 2.5 \times 3 / 16$ columns below soffit in a $1042 \mathrm{ft}^{2}$ area. Column trib. height is 3 ' 10.5 ".
6 - The partitions are located between the first floor and the underside of the mezzanine only.

## Story Weight

ROOF

| 4 | 4.5 | 7.7 | 9 |  |  |  |
|  |  |  |  |  | $\mathbf{\Sigma =}$ | $\mathbf{2 8 6}$ |

| Floor Levels | Total Seismic Weight <br> (kips) |
| :--- | :---: |
| Roof | 229 |
| Second Floor | 286 |
| First Floor |  |
| $\mathbf{\Sigma}=$ |  |

## Notes

1 - Seismic base is set at the first floor.
2 - Elevations are estimated based upon Sheet A2.2 in the 1992 drawings and are specified with respect to top of slab at first floor.

3 - Detail EAS2 in the original 1961 drawings specifies typ. 8" CMU walls as solid grouted. Normal weight CMU is assumed. $\mathrm{W}_{\text {CMU }}=84 \mathrm{psf}$.

4- The nonstructural soffit is attached to wall on Line C. Its contribution to the roof is calculated as a reaction assuming a simple supported beam spanning from the first floor to the roof with a lateral load located at El. 8'-8".

5 - The wall weight includes exterior and interior CMU walls. Out-of-plane bracing of the wall with the diaphragms determines the tributary height at each level. Exterior wall elevations with color-coded tributary areas are shown in the next page.

## Tributary Wall Heights

## Period

| $\mathrm{C}_{\mathrm{t}}=$ | 0.02 |
| :--- | ---: |
| $\mathrm{~h}_{\mathrm{n}}(\mathrm{ft})=$ | 15.50 |
| $\mathrm{~B}=$ | 0.75 | | $\mathrm{T}=$ | 0.16 |
| :--- | :--- |

Notes:
1- The period is calculated per ASCE 41-17 Equation 4-4.

$$
\mathrm{T}=\mathrm{C}_{\mathrm{t}} \cdot \mathrm{~h}_{\mathrm{n}}{ }^{\mathrm{B}}
$$

2- Ct and B are for "all other framing system" per ASCE 41-17 Section 4.4.2.4.
3 - The building height is taken from the first floor to the roof.
where
$T=$ Fundamental period (s) in the direction under consideration;
$C_{t}=0.035$ for moment-resisting frame systems of steel (Building Types Sl and Sla);
$=0.018$ for moment-resisting frames of reinforced concrete (Building Type C1);
$=0.030$ for eccentrically braced steel frames (Building Types S2 and S2a);
0.020 for all other framing systems;
$h_{n}=$ Henght (ft) above the base to the roof level;
$\beta=0.80$ for moment-resisting frame systems of steel (Building Types S1 and S1a);
$=0.90$ for moment-resisting frame systems of reinforced concrete (Building Type C1); and
0.75 or all other framing systems.

## Site Parameters

| Period (s) | Sa $(\mathrm{g})$ |
| :---: | :---: |
| 0 | 0.57 |
| 0.14 | 1.43 |
| 0.68 | 1.43 |
| 0.83 | 1.17 |
| 0.98 | 0.99 |
| 1.00 | 0.97 |
| 1.15 | 0.84 |
| 1.30 | 0.75 |
| 1.45 | 0.67 |
| 1.60 | 0.61 |
| 1.75 | 0.55 |
| 1.90 | 0.51 |
| 2.05 | 0.47 |
| 2.20 | 0.44 |
| 2.35 | 0.41 |

| BSE-C |  |

|  |  |

Notes
1- Spectral accelerations based upon site class provided in "Table 1 - UCSF Group 3 Buildings Geotechnical Characteristics and Geohazards". Procedure as specified in ASCE 41-17, Section 2.4.1.7 is used to develop General Response Spectrum shown above.
2 - Per Section 2.4.1.7 of ASCE 41-17, use of spectral response acceleration in the extreme short-period range ( $T<T_{0}$ ) shall only be permitted in dynamic analysis procedures and only for modes other than the fundamental mode.

3- Per Section 4.4.2.3 for Tier 1 screening in ASCE 41-17, the spectral acceleration, $S a$, is computed as the least value of $S_{x_{1}} / T$, and $S_{x s}$.

## Seismic Force Vertical Distribution

| Horizontal Response Spectrum Seismic Parameters |  |  |
| :---: | :---: | :---: |
| Hazard Level | BSE-C |  |
| Site Class | D |  |
| $\mathrm{S}_{\mathrm{CS}}=$ | 1.431 |  |
| $\mathrm{S}_{\mathrm{C} 1}=$ | 0.971 |  |
| T= | 0.16 | S |
| Sa= | 1.43 | g |
| W= | 550 | kips |
| $\mathrm{C}=$ | 1.0 | Per ASCE 41-17 Table 4-7 |
| $\mathrm{V}=$ | 787 | kips |

$\mathrm{k}=\quad 1.00 \quad$| Per ASCE $41-17$ Section $4.4 .2 .2, \mathrm{~K}=1.0$ for periods less |
| :--- |
| than 0.5 sec and $K=2.0$ for $T>2.5 \mathrm{sec}$. It varies linearly in |
| between 0.5 sec and 2.5 sec period. |

| Floor Levels | Story Height | Total Height, $\mathbf{H}$ | Weight, $\mathbf{w}$ | $\mathbf{W} \mathbf{x} \mathbf{H}^{\mathbf{k}}$ | coeff | Fx | Story Shear, $\mathbf{V}$ |

|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
| Roof |  |  |  |  |  |  |  |
| Second Floor | 7.75 | 15.50 | 229 | 3,546 | 0.61 | 484 | 484 |
|  | 7.75 | 7.75 | 286 | 2,220 | 0.39 | 303 | 787 |

Notes:
1- The base of building is set at first floor.
$2-\mathrm{S}_{\mathrm{XS}}$ and $\mathrm{S}_{\mathrm{X} 1}$ refer to the spectral response at 0.2 s and 1.0 s , respectively, after applying site amplification factors Fa and Fv. These values match $\mathrm{S}_{\mathrm{CS}}$ and $\mathrm{S}_{\mathrm{C} 1}$ for the building, per the table "UCSF Group 3 Buildings Geotechnical Characteristics and Geohazards".
3- Per Section 4.4.2.3 in ASCE 41-17, the spectral acceleration, Sa , is computed as the least value of $\mathrm{S}_{\mathrm{x} 1} / T$, and $\mathrm{S}_{\mathrm{xs}}$.
4- Modification Factor, C, per ASCE 41-17, Table 4-7.

| Table 4-7. Modification Factor, $\boldsymbol{C}$ |
| :--- |

5 - The structure contains a flexible wood diaphragm at the roof and a rigid mezzanine diaphragm at the mezzanine slabs. Since the concrete diaphragms are only partial and do not extend across the entire floor plan, the building is considered to be dominantly type RM1 and a $\mathrm{C}=1.0$ is used.

## Seismic Force Distribution in Shear Walls

## Seismic Force Acting in Longitudinal (E-W) Direction

| Level | Grids | Seismic Force <br> (kips) | Total Length Seismic <br> Force is Acting (ft) | Distributed Load <br> (kips/ft) | Span Length (ft) | Reaction (kips) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Roof | A-C | 484 | 40.0 | 12.10 | 40.0 | 242 |
| Second Floor | A-B | 303 | 40.0 | 7.57 | 20.0 | 76 |
| Second Floor | B-C | 303 | 40.0 | 7.57 | 20.0 | 76 |

Forces are distributed to walls based upon tributary area. The applied force is simplified to be a uniform line load and local increase due to the location of the mezzanine masses are ignored.

Diaphragm Forces at Roof

## Diaphragm Forces at Second Floor

## Seismic Force Distribution in Shear Walls

Seismic Force Acting in Transverse (N-S) Direction

| Level | Grids | Seismic Force <br> $\mathbf{( k i p s )}$ | Total Length Seismic <br> Force is Acting (ft) | Distributed Load <br> $\mathbf{( k i p s / f t )}$ | Span Length (ft) | Reaction (kips) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Roof | $1-2$ | 484 | 88.0 | 5.50 | 38.5 | 106 |
| Roof | $2-4$ | 484 | 88.0 | 5.50 | 49.5 | 136 |
| Second Floor | $1-2$ | 303 | 88.0 | 3.44 | 38.5 | 66 |
| Second Floor | $2-3$ | 303 | 88.0 | 3.44 | 32.5 | 56 |
| Second Floor | $3-4$ | 303 | 88.0 | 3.44 | 17.0 | 29 |

Forces are distributed to walls based upon tributary area. The applied force is simplified to be a uniform line load and local increase due to the location of the mezzanine masses are ignored.

| Second Floor - First Floor | 29 | 165 | 20 | 13 | 70 | ОК |

- Shear stress check is performed following the ASCE 41-17 Tier 1 screening criteria, and the BSE-C site modified spectral response parameters.

2 - Ms factor per ASCE 41-17 Table 4-8.
Table 4-8. $\boldsymbol{M}_{\boldsymbol{s}}$ Factors for Shear Walls

|  | Level of Performance |  |  |
| :--- | :---: | :---: | :---: |
| Wall Type | CP $^{\boldsymbol{a}}$ | LS $^{\boldsymbol{a}}$ | $\mathbf{1 0}^{\boldsymbol{a}}$ |
| Reinforced concrete, precast <br> concrete, wood, reinforced <br> masonry, and cold-formed | 4.5 | 3.0 | 1.5 |
| steel |  |  |  |

${ }^{a}$ CP = Collapse Prevention, LS = Life Safety, $1 \mathrm{O}=$ Immediate
Occupancy.

- Tier 1 shear stress limit of $70 \mathrm{lb} / \mathrm{in}^{2}$ is defined for buildings with reinforced masonry shear walls based upon Table 17-34/ASCE 41-17.
- Gridline 2 contains steel truss connecting the flexible roof diaphragm to a concrete shear wall. This calculations assumes the lateral load is resisted by CMU wall and concrete wall below truss.
$5-\mathrm{Em}=900 \mathrm{f}$ ' m per ASCE 41-17 Section 11.2.3.7 \& TMS 402 Section 1.8.2.2.1 for concrete block.
$6-f^{\prime} m=1500$ psi for reinforced soild grouted units per ASCE 41-17, Table 11-2b.
$7-E c=w^{1.5} \times 33 \times$ sqrt(f'c) per ACI 318 Section 8.5.1. Compressive strength of wall below truss is 3000 psi based on General Notes in 1992 drawings.

## Plan of connection locations

See the following pages for the out-of-wall anchorage calculations of connection A, B, and C, which are located as indicated on the plans below:

Second floor Plan

Flexible Diaphragm Connection Forces Per Tier 2 Procedure - Connection "A"

Tier 2 Procedure per Section 7.2.11.1 in ASCE 41-17:
7.2.II.1 Out-of.-Plane Wall Anchorage
.2.In.I Out-off-Plane Wall Anchorage to Diaphragms. Each
wall shall be positively anchored to all diaphragms that provide
lateral support for the wall or are vertically supported by the wall.

| $F_{p}=0.4 S_{X S} k_{a} k_{h} \chi W_{p}$ | $(7-9)$ |
| :---: | :---: |
| $F_{p, \text { min }}=0.2 k_{a} \chi W_{p}$ | $(7-10)$ |
| $k_{a}=1.0+\frac{L_{f}}{100}$ | $(7-11)$ |
| $k_{h}=\frac{1}{3}\left(1+\frac{2 z_{a}}{h_{n}}\right)$ | $(7-12)$ |

Per Section 10.3 .6 .1 in ASCE $41-17$, "cast-in-place connection systems shall be
considered force-controlled."

Per Section 7.5.2.2.2 in ASCE 41-17:
7.5.2.2.2 Acceptance Criteria for Force-Controlled Actions for LSP or LDP. Force-controlled actions in primary and secondary
components shall satisfy Eq. ( $7-37$ ):

$$
\begin{equation*}
\kappa Q_{C L}>Q_{U F} \tag{7737}
\end{equation*}
$$

where $Q_{C L}=$ Lower-bound strength of a force-controlled action of an element at the deformation level under consideration.
$Q_{C L}$, the lower-bound strength, shall be determined $Q_{C L}$, the lower-bound strength, shall be determined
considering all coexisting actions on the component considering all coexisting actions on the componen
under the loading condition by procedures specified in under the loading condition by proc
Chapters 8 through 12,14 , and 15 .
$\kappa=$ Knowledge factor defined in Section 6.2.4.
$Q_{U F}=$ Force-controlled action caused by gravity loads in

$$
\begin{aligned}
& \text { combination with earthouake forces: } \\
& \qquad Q_{U F}=Q_{G} \pm \frac{\chi Q_{E}}{C_{1} C_{2} J}
\end{aligned}
$$

Fastening point:

## 6 Warnings

- The anchor design methods in PROFIS Engineering require rigid anchor plates per current regulations (AS 5216:2018, ETAG 001/Annex C, EOTA TR029 etc.). This means load re-distribution on the anchors due to elastic deformations of the anchor plate are not considered - the anchor plate is assumed to be sufficiently stiff, in order not to be deformed when subjected to the design loading. PROFIS Engineering calculates the minimum required anchor plate thickness with CBFEM to limit the stress of the anchor plate based on the assumptions explained above. The proof if the rigid anchor plate assumption is valid is not carried out by PROFIS Engineering. Input data and results must be checked for agreement with the existing conditions and for plausibility!
- Condition A applies where the potential concrete failure surfaces are crossed by supplementary reinforcement proportioned to tie the potential concrete failure prism into the structural member. Condition B applies where such supplementary reinforcement is not provided, or where pullout or pryout strength governs.
- For additional information about ACI 318 strength design provisions, please go to https://submittals.us.hilti.com/PROFISAnchorDesignGuide/
- An anchor design approach for structures assigned to Seismic Design Category C, D, E or F is given in ACI 318-14, Chapter 17, Section 17.2.3.4.3 (a) that requires the governing design strength of an anchor or group of anchors be limited by ductile steel failure. If this is NOT the case, the connection design (tension) shall satisfy the provisions of Section 17.2.3.4.3 (b), Section 17.2.3.4.3 (c), or Section 17.2.3.4.3 (d). The connection design (shear) shall satisfy the provisions of Section 17.2.3.5.3 (a), Section 17.2.3.5.3 (b), or Section 17.2.3.5.3 (c).
- Section 17.2.3.4.3 (b) / Section 17.2.3.5.3 (a) require the attachment the anchors are connecting to the structure be designed to undergo ductile yielding at a load level corresponding to anchor forces no greater than the controlling design strength. Section 17.2.3.4.3 (c) / Section 17.2.3.5.3 (b) waive the ductility requirements and require the anchors to be designed for the maximum tension / shear that can be transmitted to the anchors by a non-yielding attachment. Section 17.2.3.4.3 (d) / Section 17.2.3.5.3 (c) waive the ductility requirements and require the design strength of the anchors to equal or exceed the maximum tension / shear obtained from design load combinations that include $E$, with $E$ increased by $\omega_{0}$.

Castoning moots the-docign-critoria!
FASTENING MEETS THE TIER 1 / ASCE 41-17 CRITERIA

Flexible Diaphragm Connection Forces Per Tier 2 Procedure - Connection "B"

Tier 2 Procedure per Section 7.2.11.1 in ASCE 41-17:
7.2.11.1 Out-of-Plane Wall Anchorage to Diaphragms. Each wall shall be positively anchored to all diaphragms that provide
$F_{p}=0.4 S_{X S} k_{a} k_{h} \chi W_{p}$
$F_{p, \text { min }}=0.2 k_{a} \chi W_{p}$
$k_{a}=1.0+\frac{L_{f}}{100}$
$k_{h}=\frac{1}{3}\left(1+\frac{2 z_{a}}{h_{n}}\right)$

Per Section 10.3.6.1 in ASCE 41-17, "cast-in-place connection systems shall be considered force-controlled."

Per Section 7.5.2.2.2 in ASCE 41-17:
7.5.2.2.2 Acceptance Criteria for Force-Controlled Actions for
7.5.2.2.2 Acceptance Criteria for Force-Controlled Actions for
LSP or LDP. Force-controlled actions in primary and secondary components shall satisfy Eq. (7-37):
$\kappa Q_{C L}>Q_{U F} \quad$ (7-37)
where
$Q_{C L}=$ Lower-bound strength of a force-controlled action of an element at the deformation level under consideration. $Q_{C L}$, the lower-bound strength, shall be determined under the loading condition by procedures specified in Chapters 8 through 12, 14, and 15.
$\kappa=$ Knowledge factor defined in Section 6.2.4.
$Q_{U F}=$ Force-controlled action caused by gravity loads in combination with earthquake forces;

$$
Q_{U F}=Q_{G} \pm \frac{\chi Q_{E}}{C_{1} C_{2} J}
$$

## 6 Warnings

- The anchor design methods in PROFIS Anchor require rigid anchor plates per current regulations (ETAG 001/Annex C, EOTA TR029, etc.). This means load re-distribution on the anchors due to elastic deformations of the anchor plate are not considered - the anchor plate is assumed to be sufficiently stiff, in order not to be deformed when subjected to the design loading. PROFIS Anchor calculates the minimum required anchor plate thickness with FEM to limit the stress of the anchor plate based on the assumptions explained above. The proof if the rigid base plate assumption is valid is not carried out by PROFIS Anchor. Input data and results must be checked for agreement with the existing conditions and for plausibility!
- Condition A applies when supplementary reinforcement is used. The $\Phi$ factor is increased for non-steel Design Strengths except Pullout Strength and Pryout strength. Condition B applies when supplementary reinforcement is not used and for Pullout Strength and Pryout Strength. Refer to your local standard.
- Checking the transfer of loads into the base material and the shear resistance are required in accordance with ACI 318 or the relevant standard!
- An anchor design approach for structures assigned to Seismic Design Category C, D, E or F is given in ACl 318-11 Appendix D, Part D.3.3.4.3 (a) that requires the governing design strength of an anchor or group of anchors be limited by ductile steel failure. If this is NOT the case, the connection design (tension) shall satisfy the provisions of Part D.3.3.4.3 (b), Part D.3.3.4.3 (c), or Part D.3.3.4.3 (d). The connection design (shear) shall satisfy the provisions of Part D.3.3.5.3 (a), Part D.3.3.5.3 (b), or Part D.3.3.5.3 (c).
- Part D.3.3.4.3 (b) / part D.3.3.5.3 (a) require the attachment the anchors are connecting to the structure be designed to undergo ductile yielding at a load level corresponding to anchor forces no greater than the controlling design strength. Part D.3.3.4.3 (c) / part D.3.3.5.3 (b) waive the ductility requirements and require the anchors to be designed for the maximum tension / shear that can be transmitted to the anchors by a non-yielding attachment. Part D.3.3.4.3 (d) / part D.3.3.5.3 (c) waive the ductility requirements and require the design strength of the anchors to equal or exceed the maximum tension / shear obtained from design load combinations that include $E$, with $E$ increased by $\omega_{0}$.

## Fastening meets the design criteria!

FASTENING MEETS THE TIER 1 / ASCE 41-17 CRITERIA

Flexible Diaphragm Connection Forces Per Tier 2 Procedure - Connection "C"
Tier 2 Procedure per Section 7.2 .111 .1 in ASCE 41-17:
7.2.11.I Out-of-Plane Wall Anchorage to Diaphragms. Each
wall hhall be posilively anchored to all diaphragms hat provide
lateral support tor the wall or are vertically supported by the wall.

\[\)| $F_{p}=0.4 S_{X S} k_{a} k_{h} \chi W_{p}$ |
| ---: |
| $F_{p \text {.min }}=0.2 k_{a} \chi W_{p}$ |
| $k_{a}=1.0+\frac{L_{f}}{100}$ |
| $k_{h}=\frac{1}{3}\left(1+\frac{2 z_{a}}{h_{n}}\right)$ |

\]

Per Section 11.5.2 in ASCE 41-17, "anchors embedded into existing or new masonry walls shall be considered force-controlled components."

Per Section 7.5.2.2.2 in ASCE 41-17:
7.5.2.2.2 Acceptance Criteria for Force-Controlled Actions for 7.5.2.2.2 Acceptance Criteria for Force-Controlled Actions for
LSP or LDP. Force-controlled actions in primary and secondary
components shall satisfy Eq. (7-37):

$$
\kappa Q_{C L}>Q_{U F}
$$

where
$Q_{C L}=$ Lower-bound strength of a force-controlled action of an element at the deformation level under consideration $Q_{c L}$, the lower-bound streng, shall be determined under the loading condition by procedures specified in Chapters 8 through 12, 14, and 15.
$\kappa=$ Knowledge factor defined in Section 6.2.4.
$Q_{U F}=$ Force-controlled action caused by gravity loads in
combination with earthuuake forces

$$
\begin{aligned}
& \text { on with earthquake forces; } \\
& Q_{U F}=Q_{G} \pm \frac{\chi Q_{E}}{C_{1} C_{2} J}
\end{aligned}
$$

```
loads.
2-The tabe of the ICC-ES Evaluation report with the allowable tension loads for the ITW red head trubolt anchor specified in the structural drawings is included in the next page. The factor of safety is specified
on footnote (7).
3-The 4" embedment of the 5/8"$ bolt is specified on the notes of Sheet S2 in the 1992 drawings.
-The embedment factor is derived from the equation 6-5 in the TMS 402/602-16. This factor reduces the capacity of the bolt considering the actual embedment of 4 instead of the 4.5 in the ICC-ES report.
```

5 - The expected-strength to lower-bound convertion factor is calculated as the minimum value obtained from Table $9-3$ for steel, and Table $11-1$ in the ASCE $41-17$, i.e. the minimum value of $1.1^{-1}$ and $1.3^{-1}$.
6 - The lower-bound tension capacity of the anchor bolts is computed using the following equation:
$Q_{c L}=($ Embedment factor $) \times($ ES to LBconversion factor $) \times($ ICC Factor of Safety $) \times Q_{\text {ICC report }}$

## EXCERPT FROM ICC ESR-4058 REPORT FOR TRUBOLT POST INSTALLED ANCHORS

For SI: 1 inch $=25.4 \mathrm{~mm} ; 1 \mathrm{lbf}=0.0044 \mathrm{kN}, 1 \mathrm{ksi}=6.894 \mathrm{MPa}$.
${ }^{1}$ Tabulated loads are for anchors installed in fully grouted CMU wall construction consisting of materials in compliance with Section 3.2 of this report. The specified compressive strength of masonry, $f_{m}^{\prime}$, is minimum $2,000 \mathrm{psi}(13.8 \mathrm{MPa}$ ) at 28 days.
${ }^{2}$ Allowable loads are based on periodic special inspection being provided during anchor installation. Special inspection requirements must comply with Section 4.3 of this report.
${ }^{3}$ Allowable loads may be increased in accordance with Section 5.3 and Table 3 of this report, where permitted by the IBC or its referenced standards.
${ }^{4}$ Embedment depth is measured from the outside face of the masonry to the end of the mandrel.
${ }^{5}$ Critical and minimum edge distances and critical and minimum spacing must comply with this table. Refer to Figure 2 . Critical edge distance and critical spacing are valid for anchors resisting the tabulated allowable tension or shear loads. Table 2 tabulates allowable tension and shear load reduction factors for anchors installed between critical and minimum edge distances and spacing.
${ }^{6}$ Figure 2 illustratos parmittod and prohihitod anchor installation locations. Section 4.2 of this report provides additional installation details.
TTabulated allowable loads are based on a factor of safety of five (5)
${ }^{8}$ Critical and minimum end distance, cnucal and minimum spacing, and minimum edge distance must comply with this table and Figure 3. Critical end distance and critical spacing are valid for anchors resisting the tabulated allowable tension or shear loads. Table 2 for allowable tension and shear load reduction factors for anchors installed between critical and minimum end distances and spacing.

resulting compression force in ( $\mathrm{x} / \mathrm{y}$ ) $=(\mathrm{Q} .000 /-1.747)$ : 174 [lb]

Anchor forces are calculated based on the assumption of a rigid anchor plate.

## Tension demand including moment contribution

[^0]:    ${ }^{1}$ The evaluations at UCSF translate the Tier 1 evaluation to a Seismic Performance Level rating using professional judgment discussed among the Seismic Review Committee. Non-compliant items in the Tier 1 evaluation do not automatically put a building into a particular rating category, but such items are evaluated along with the combination of building features and potential deficiencies, focused on the potential for collapse or serious damage to the gravity supporting structure that may threaten occupant safety.

[^1]:    ${ }^{2}$ For these Tier 1 evaluations, we do not visit all spaces of the building; we rely on campus staff to report to us their understanding of if and where nonstructural hazards may occur.
